

7 Critical Reasons for Microsoft 365 Backup

The case for why
organizations need to protect
Microsoft 365 data

7 Critical Reasons for Microsoft 365 Backup

Introduction

Do you have control of your Microsoft 365 data? Do you have access to all the items you need? The knee-jerk reaction is typically, "Of course I do," or "Microsoft takes care of it all."

But if you really think about it — are you sure?

Microsoft takes care of quite a bit, and provides a great service for their customers. However, Microsoft's primary focus is on managing the Microsoft 365 infrastructure and maintaining uptime. They are empowering YOU with the responsibility of your data. **The misconception that Microsoft fully backs up your data on your behalf is quite common, and without a shift in mindset, could have damaging repercussions when this responsibility is left unattended.**

Ultimately, you need to ensure your organization is correctly backing up (and if applicable, archiving) your Exchange Online, SharePoint Online, OneDrive for Business and Microsoft Teams data.

This report explores the hazards of not having a Microsoft 365 backup in your arsenal, and solutions to fill the gap of long-term retention and data protection.

"We worried about the backup and retention policies in Microsoft 365. That's why we decided to ensure we have a backup of our data residing in Microsoft 365."

— Karen St.Clair, IT Manager, Colombia Power & Water Systems

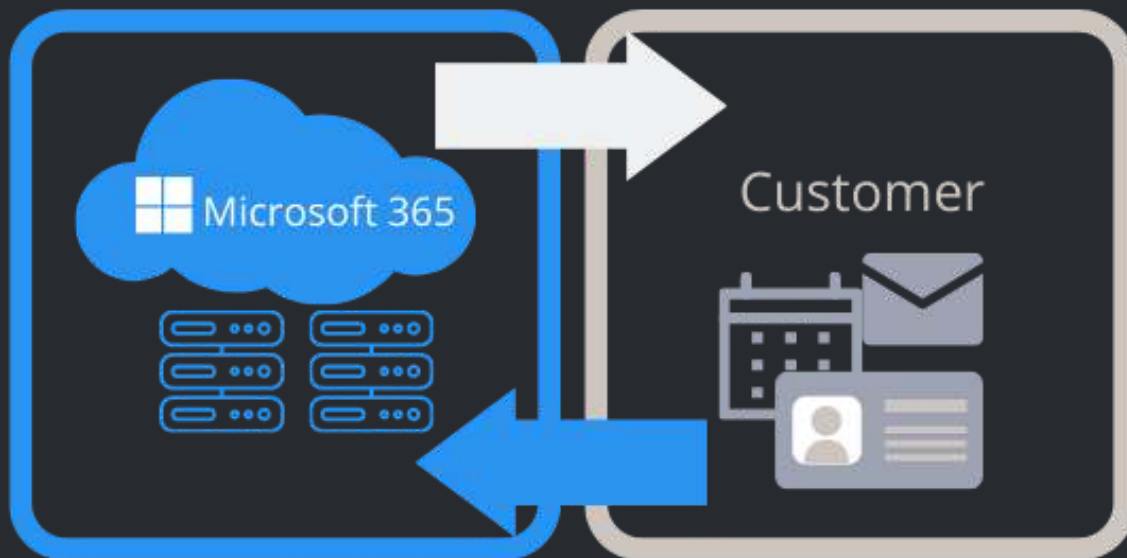

7 Critical Reasons for Microsoft 365 Backup

The big Microsoft 365 misconception

The misunderstanding falls between Microsoft's perceived responsibility and the user's actual responsibility of protection and long-term retention of their Microsoft 365 data. **The backup and recoverability that Microsoft provides and what users assume they are getting are often different.** Meaning, aside from the standard precautions Microsoft 365 has in place, you may need to re-assess the level of control you have of your data and how much access you truly have to it.

Microsoft 365 offers geo redundancy, which is often mistaken for backup. Backup takes place when a historical copy of data is made and then stored in another location. However, it is even more important that you have direct access to and control over that backup. So if data is lost, accidentally deleted or maliciously attacked, for example — you can quickly recover. Geo redundancy, on the other hand, protects against site or hardware failure, so if there is an infrastructure crash or outage, your users will remain productive and often oblivious to these underlying issues.

Microsoft takes care of infrastructure, but the data remains the customer's responsibility

7 Critical Reasons for Microsoft 365 Backup

7 reasons why backing up Microsoft 365 is critical

As a robust and highly capable Software as a Service (SaaS) platform, Microsoft 365 fits the needs of many organizations perfectly. It provides application availability and uptime, but ensuring that data is backed up is the responsibility of each customer, and doing so can protect you against many other business continuity threats.

You or your boss might be thinking, "The recycle bin is probably good enough." This is where many people get it wrong. **The average length of time from data compromise to discovery is over 140 days**¹. A shockingly large gap. **The likelihood is high that you won't notice something is missing or gone until it's too late for the recycle bin.**

By talking with hundreds of IT professionals across the globe who have migrated to Microsoft 365, seven vulnerabilities in data protection rise to the top:

Accidental
Deletion

External
threats

Internal
threats

Legal & compliance
needs

Retention gaps &
confusion

Managing hybrid
deployments &
migrations

Teams data structure

7 Critical Reasons for Microsoft 365 Backup

Reason #1: Accidental deletion

If you delete a user, whether you meant to or not, that deletion is replicated across the network, along with the deletion of their OneDrive for Business account and mailbox.

Native recycle bins and version histories included in Microsoft 365 can only protect you from data loss in a limited way, which can turn a simple recovery from a proper backup into a big problem after Microsoft 365 has geo-redundantly deleted the data forever, or if the retention period has passed.

There are two types of deletions in the Microsoft 365 platform, soft delete and hard delete. An example of soft delete is emptying the Deleted Items folder. It is also referred to as "Permanently Deleted." In this case, permanent is not completely permanent, as the item can still be found in the Recoverable Items folder.

A hard delete is when an item is tagged to be purged from the mailbox database completely. Once this happens, it is unrecoverable, period.

Reason #2: Retention policy gaps & confusion

The fast pace of business in the digital age lends itself to continuously evolving policies, including retention policies that are difficult to keep up with, let alone manage. Just like hard and soft delete, **Microsoft 365 has limited backup and retention policies that can only fend off situational data loss, and is not intended to be an all-encompassing backup solution.**

Another type of recovery, a **point-in-time restoration of mailbox items, is not in scope with Microsoft.** In the case of a catastrophic issue, a backup solution can provide the ability to roll back to a previous point-in-time prior to this issue and saving the day.

With a Microsoft 365 backup solution like FLxStore, there are no retention policy gaps or restore inflexibility. Short term backups or long-term archives, granular or point-in-time restores, everything is at your fingertips making data recovery fast, easy and reliable. For those needing regular e-Discovery of data across your organization (increasingly common), Donoma OneVault provides secure, easy to use e-Discovery within Microsoft 365 data. Because OneVault indexes all the data, searches are powerfully fast and can be run without burdening IT to find data within backup data that is not indexed.

7 Critical Reasons for Microsoft 365 Backup

Reason #3: Internal Security Threats

The idea of a security threat brings to mind hackers and viruses. However, businesses experience threats from the inside, and they are happening more often than you think. Organizations fall victim to threats posed by their very own employees, both intentionally and unintentionally.

Access to files and contacts changes so quickly, it can be hard to keep an eye on those in which you've installed the most trust. **Microsoft has no way of knowing the difference between a regular user and a terminated employee attempting to delete critical company data before they depart. In addition, some users unknowingly create serious threats by downloading infected files or accidentally leaking usernames and passwords to sites they thought they could trust.**

Another example is evidence tampering. Imagine an employee strategically deleting incriminating emails or files — keeping these objects out of the reach of the legal, compliance or HR departments. (But not out of reach of a real-time compliance archive such as OneVault.)

Reason #4 - External security threats

Malware and viruses, like ransomware, have done serious damage to organizations across the globe. Not only is company reputation at risk, but the privacy and security of internal and customer data as well.

External threats can sneak in through emails and attachments, and it isn't always enough to educate users on what to look out for — especially when the infected messages seem so compelling. Exchange Online's limited backup/recovery functions are inadequate to handle serious attacks. Regular backups will help ensure a separate copy of your data is uninfected and that you can recover quickly.

Reason #5: Legal & compliance requirements

Sometimes you need to retrieve emails, files or other types of data. This kind of e-Discovery used to be limited to compliance audits and legal action; but today they are routinely needed for continuity during turnover, for sales, customer service and HR needs. Microsoft has built-in a couple of safety nets (litigation hold and retention, if those features are added to your subscription). But, **these are not a robust backup solution that will keep your company out of legal trouble. For example, with a backup and archiving solution, if you accidentally delete emails or documents before implementing a legal hold, you'll still be able to get them back to ensure you meet your legal obligations.**

Legal requirements, compliance requirements and access regulations vary between industries and countries, but fines, penalties and legal disputes are three things you don't have room for on your to-do list.

7 Critical Reasons for Microsoft 365 Backup

Reason #6: Managing hybrid email deployments and migrations to Microsoft 365

Organizations that adopt Microsoft 365 typically need a window of time to serve as a transition window between on-premises Exchange and Microsoft 365 Exchange Online. Some even leave a small portion of their legacy system in place to have added flexibility and additional control. These hybrid email deployments are common, yet pose additional management challenges.

The right Microsoft 365 backup solution, such as FLxStore, should be able to handle hybrid email deployments, and treat exchange data the same, making the source location irrelevant.

Reason #7: Teams data structure

Microsoft Teams is gaining rapid adoption and growth with the increase in remote working. It's now the center of our productivity universe. Microsoft structures Teams as a user interface that brings together Microsoft 365 services, such as SharePoint Online and OneDrive for Business. This approach provides agile, real-time communication and collaboration for teams.

You need to protect data in these locations, but that's not all you need to protect. Teams has settings, configurations, and membership which all need to be protected and recoverable. A purpose-built backup solution can protect not only the data but also these settings and their associated interconnections between applications. **For archiving Teams data, we recommend adding Donoma OneVault.**

More than ever before, people are spinning up Teams for projects and special initiatives at a rapid rate. **But once you complete a project you probably need to keep a copy of the ended project for long-term needs such as legal and compliance requests. What often happens is that these Teams get mistakenly deleted or retention misapplied, which makes other files or essential documents unavailable.**

OneVault can also help in short-term scenarios. For example, if an employee says something inappropriate in a Teams conversation, but then deletes the message, OneVault makes those chats recoverable and available to HR for review.

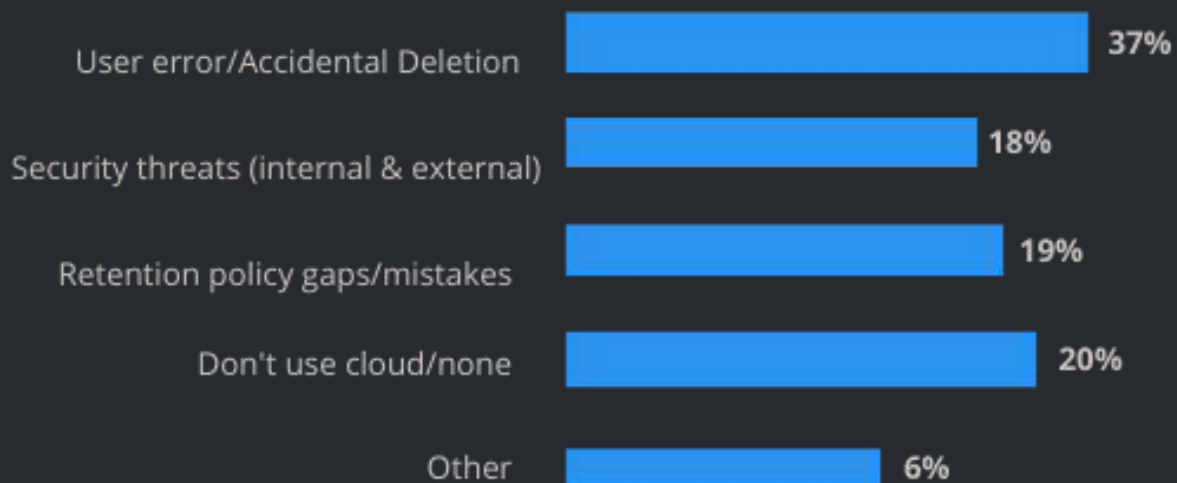

7 Critical Reasons for Microsoft 365 Backup

How often do these reasons happen?

By now you understand why it's critically important to back up and even archive your Microsoft 365 data. But you're probably wondering to what extent these seven data protection vulnerabilities actually happen. Unfortunately, the answer is far too often...

Over 1,000 IT professionals were asked what forms of data loss they had experienced in the cloud. User error/accidental deletion, security threats and retention gaps all made the list from 18% to as high as 37%.

What forms of data loss have you experienced within the cloud?

The scary reality is that even though sensitive cloud data is stored in Office documents, an estimated 76% is not being backed up². In fact, IDC states that 6 out of every 10 organizations don't have a data protection plan for their Microsoft 365 estates³. Do you work in one of these unprotected organizations? If so, hopefully you now have the insights available through this report to encourage your organization to protect its Microsoft 365 data.

7 Critical Reasons for Microsoft 365 Backup

Conclusion

We encourage you to take a closer look at your current backup and archiving solutions. There are likely data security and governance gaps you may not have been aware of before.

You already made a smart business decision by deploying Microsoft 365, now FLxStore and its archiving companion Donoma OneVault offers you the solutions you need to protect your Microsoft 365 data and avoid the unnecessary risks of data loss.

Next Steps

About FLxStore

FLxStore™ BaaS securely protects your data in multiple locations with the fastest Return to Operation statistics in the industry. You get complete protection and Veeam's industry-leading features so affordable you can backup servers and user drives. One copy of your backup remains on site within an evergreen appliance; plus, another copy is retained in geo-diverse locations

[Meet FLxStore](#)

About OneVault

OneVault provides archiving and records management that supports the proliferation of communication systems people use in their jobs every day. Email, instant messaging, team collaboration spaces and voicemail just to name a few. With OneVault you get a single interface to manage retention across diverse systems. Communication records now are centralized in an independent platform that makes it easy to orchestrate consistent policies for retention, access and data cleanup. The single pane of glass for managing and working with records makes e-Discovery process secure, accountable and best of all, intuitive to use.
